Laryngeal Mask Airway (LMA)

Indications and Use for the NH EMT-Intermediate and Paramedic

NEW HAMPSHIRE
Division of Fire Standards & Training and Emergency Medical Services
Introduction

- The LMA was invented by Dr. Archie Brain at the London Hospital in Whitechapel in 1981.

- The LMA consists of two parts:
  - The mask
  - The tube

- The LMA has proven to be a very effective management tool for the airway.
The LMA design:

- Provides an “oval seal around the laryngeal inlet” once the LMA is inserted and the cuff inflated.

- Once inserted, it lies at the crossroads of the digestive and respiratory tracts.
Contraindications

- Greater than 14 to 16 weeks pregnant
- Patients with multiple or massive injury
- Massive thoracic injury
- Massive maxillofacial trauma
- Patients at risk of aspiration

NOTE: Not all contraindications are absolute
Complications

- Throat soreness
- Dryness of the throat and/or mucosa
- Complications due to improper placement vary based on the nature of the placement
Preparation

- Step 1: Size selection
- Step 2: Examination of the LMA
- Step 3: Check deflation and inflation of the cuff
- Step 4: Lubrication of the LMA
- Step 5: Position the Airway
Step 1: Size Selection

- Verify that the size of the LMA is correct for the patient

- Recommended Size guidelines:
  - Size 1: under 5 kg
  - Size 1.5: 5 to 10 kg
  - Size 2: 10 to 20 kg
  - Size 2.5: 20 to 30 kg
  - Size 3: 30 kg to small adult
  - Size 4: adult
  - Size 5: Large adult/poor seal with size 4
Step 2: Examine the LMA

- Visually inspect the LMA cuff for tears or other abnormalities
- Inspect the tube to ensure that it is free of blockage or loose particles
- Deflate the cuff to ensure that it will maintain a vacuum
- Inflate the cuff to ensure that it does not leak
Step 3: Deflation & Inflation

- Slowly deflate the cuff to form a smooth flat wedge shape which will pass easily around the back of the tongue and behind the epiglottis.

- During inflation the maximum air in cuff should not exceed:
  - Size 1: 4 ml
  - Size 1.5: 7 ml
  - Size 2: 10 ml
  - Size 2.5: 14 ml
  - Size 3: 20 ml
  - Size 4: 30 ml
  - Size 5: 40 ml
Step 4: Lubrication

- Use a water soluble lubricant to lubricate the LMA
- Only lubricate the LMA just prior to insertion
- Lubricate the back of the mask thoroughly

Important Notice:

- Avoid excessive amounts of lubricant
  - on the anterior surface of the cuff or
  - in the bowl of the mask.
- Inhalation of the lubricant following placement may result in coughing or obstruction.
Step 5: Positioning of the Airway

- Extend the head and flex the neck

- Avoid LMA fold over:
  - Assistant pulls the lower jaw downwards.
  - Visualize the posterior oral airway.
  - Ensure that the LMA is not folding over in the oral cavity as it is inserted.
LMA Insertion Technique
LMA Insertion  Step 1

- Grasp the LMA by the tube, holding it like a pen as near as possible to the mask end
- Place the tip of the LMA against the inner surface of the patient’s upper teeth
LMA Insertion

Step 2

- Under direct vision:
  - Press the mask tip upwards against the hard palate to flatten it out.
  - Using the index finger, keep pressing upwards as you advance the mask into the pharynx to ensure the tip remains flattened and avoids the tongue.
LMA Insertion

Step 3

- Keep the neck flexed and head extended:

  - Press the mask into the posterior pharyngeal wall using the index finger.
LMA Insertion

Step 4

- Continue pushing with your index finger.
- Guide the mask downward into position.
LMA Insertion

Step 5

- Grasp the tube firmly with the other hand
- Then withdraw your index finger from the pharynx.
- Press gently downward with your other hand to ensure the mask is fully inserted.
LMA Insertion  Step 6

- Inflate the mask with the recommended volume of air.
- Do not over-inflate the LMA.
- Do not touch the LMA tube while it is being inflated unless the position is obviously unstable.
  - Normally the mask should be allowed to rise up slightly out of the hypopharynx as it is inflated to find its correct position.
Verify Placement of the LMA

- Connect the LMA to a Bag-Valve Mask device or low pressure ventilator
- Ventilate the patient while confirming equal breath sounds over both lungs in all fields and the absence of ventilatory sounds over the epigastrium
Securing the LMA

- Insert a bite-block or roll of gauze to prevent occlusion of the tube should the patient bite down.

- Now the LMA can be secured utilizing the same techniques as those employed in the securing of an endotracheal tube.
Verify

- During ventilation observe end-tidal CO₂ monitor or pulse oximetry to confirm oxygenation
Problems with LMA Insertion

- Failure to press the deflated mask up against the hard palate or inadequate lubrication or deflation can cause the mask tip to fold back on itself.
Problems with LMA Insertion

- Once the mask tip has started to fold over, this may progress, pushing the epiglottis into its down-folded position causing mechanical obstruction.
Problems with LMA Insertion

- If the mask tip is deflated forward it can push down the epiglottis causing obstruction

- If the mask is inadequately deflated it may either
  - push down the epiglottis
  - penetrate the glottis
